4 Advanced Concepts Welding Team Positions at General Dynamic Electric Boat

My department, Welding and NDT Engineering, has **four** positions open for an entry to senior level engineer in our newly formed Advanced Concepts welding team. The goal of this team is to be proactive by initiating, executing, and implementing new technologies into the shipyard, and developing new material systems. The engineers in this group have the opportunity to perform hands on laboratory work side by side with skilled Welders to develop, test and evaluate new technologies that will help advance production or further develop material systems. This position is heavily involved with materials studies related to welding and welding consumables and is an excellent opportunity for a multi-faceted engineering role with real responsibility and project management on day one!

The position is open for a **period of two weeks and is closing on Thursday August 31, 2023**. Interested applicants should apply at [https://www.gdeb.com/careers/](https://www.gdeb.com/careers/). The specific job posting is listed as "**Innovative Material and Process R&D Engineer**" ID 2023-9791. I urge those who are interested not to wait, as the job posting will only be open for a short time. Please note that as a defense contractor for the United States Government, EB can only accept applicants with valid US citizenship.

Applicants are also encouraged to view the EB website for more information on the company. EB has hired a significant number of engineers in the past couple of years. The company is ramping up to support increased production of VIRGINIA Class submarines and is starting construction on a new class of submarines (COLUMBIA). There is a great deal of work to be done and we’re excited to add a new face to our team.

If you have any additional questions, please do not hesitate to ask!

Best,
Sarah Siddiqui
